

Component: Bea WebLogic**CVSS Score:** 5.8**CVE-2004-2320:** <https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2004-2320>

The default configuration of BEA WebLogic Server and Express 8.1 SP2 and earlier, 7.0 SP4 and earlier, 6.1 through SP6, and 5.1 through SP13 responds to the HTTP TRACE request, which can allow remote attackers to steal information using cross-site tracing (XST) attacks in applications that are vulnerable to cross-site scripting.

Component: Linux Kernel.**CVSS Score:** 7.4**CVE-2016-2069:** <https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2016-2069>

Race condition in arch/x86/mm/tlb.c in the Linux kernel before 4.4.1 allows local users to gain privileges by triggering access to a paging structure by a different CPU. A flaw was discovered in a way the Linux deals with paging structures. When Linux invalidates a paging structure that is not in use locally, it could, in principle, race against another CPU that is switching to a process that uses the paging structure in question. A successful exploit would result in a user thread running with a stale cached virtual->physical translation. If the translation in question were writable and the physical page got reused for something critical (e.g. a page table), then this would permit privilege escalation without any syscall.

Component: Linux Kernel**CVSS Score:** 6.2**CVE-2016-2543:** <https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2016-2543>

The `snd_seq_ioctl_remove_events` function in `sound/core/seq/seq_clientmgr.c` in the Linux kernel before 4.4.1 does not verify FIFO assignment before proceeding with FIFO clearing, which allows local users to cause a denial of service (NULL pointer dereference and OOPS) via a crafted `ioctl` call.

Component: OpenVPN**CVSS Score:** 3.7**CVE-2016-6329:** <https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2016-6329>

Ciphers with 64-bit block sizes used in CBC mode were found to be vulnerable to birthday attack when key renegotiation doesn't happen frequently or at all in long running connections. 3DES cipher as used in TLS protocol is vulnerable to this attack, that allows remote attacker to recover partial plaintext information (XOR of two plaintext blocks). This is a generic cryptographic weakness, not a vulnerability in OpenVPN per se
